

Turbulence Auto-Pirep System

TAPS

I-CNS Conference, May 2003

Dr. Paul A. Robinson
President, AeroTech
paulrobinson@atr-usa.com

Improved Turbulence Situational Awareness

*Developed as part of the
Turbulence Element of
NASA's Aviation Safety
Program*

- ✓ **Complementary technology**
- ✓ **Non flight critical software**

The Turbulence Problem

Current turbulence pireps

inconsistent

late

subjective

only "seen" by ATC

Economic impact of turbulence encounters

flight attendant injuries

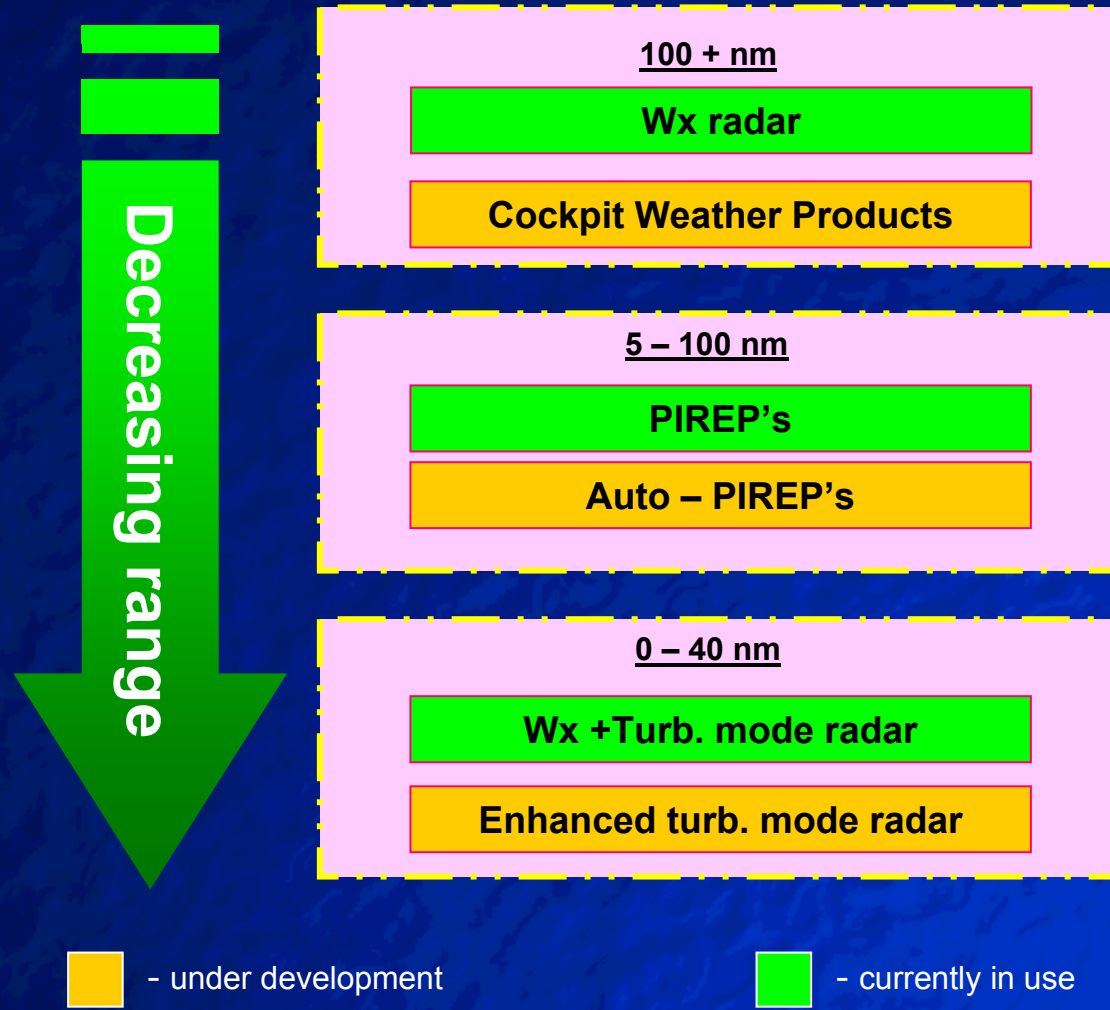

passenger injuries

operational inefficiencies

NAS inefficiencies

Estimated Costs > \$100M / year

Seamless Hierarchy of Airborne Turbulence Products

1. Aircraft hits turbulence.
2. If loads are above a threshold then algorithm generates and broadcasts an alert packet:
 - position & time
 - load
 - aircraft parameters from databus

TAPS Overview

communications infrastructure

1. Aircraft receives packet.
2. Scales hazard to type & configuration.
3. Displays to flight crew (if at or above threshold).

1. Packet received on ground & stored in database.
2. Presented on map, scaled to pilot's aircraft (if at or above threshold).

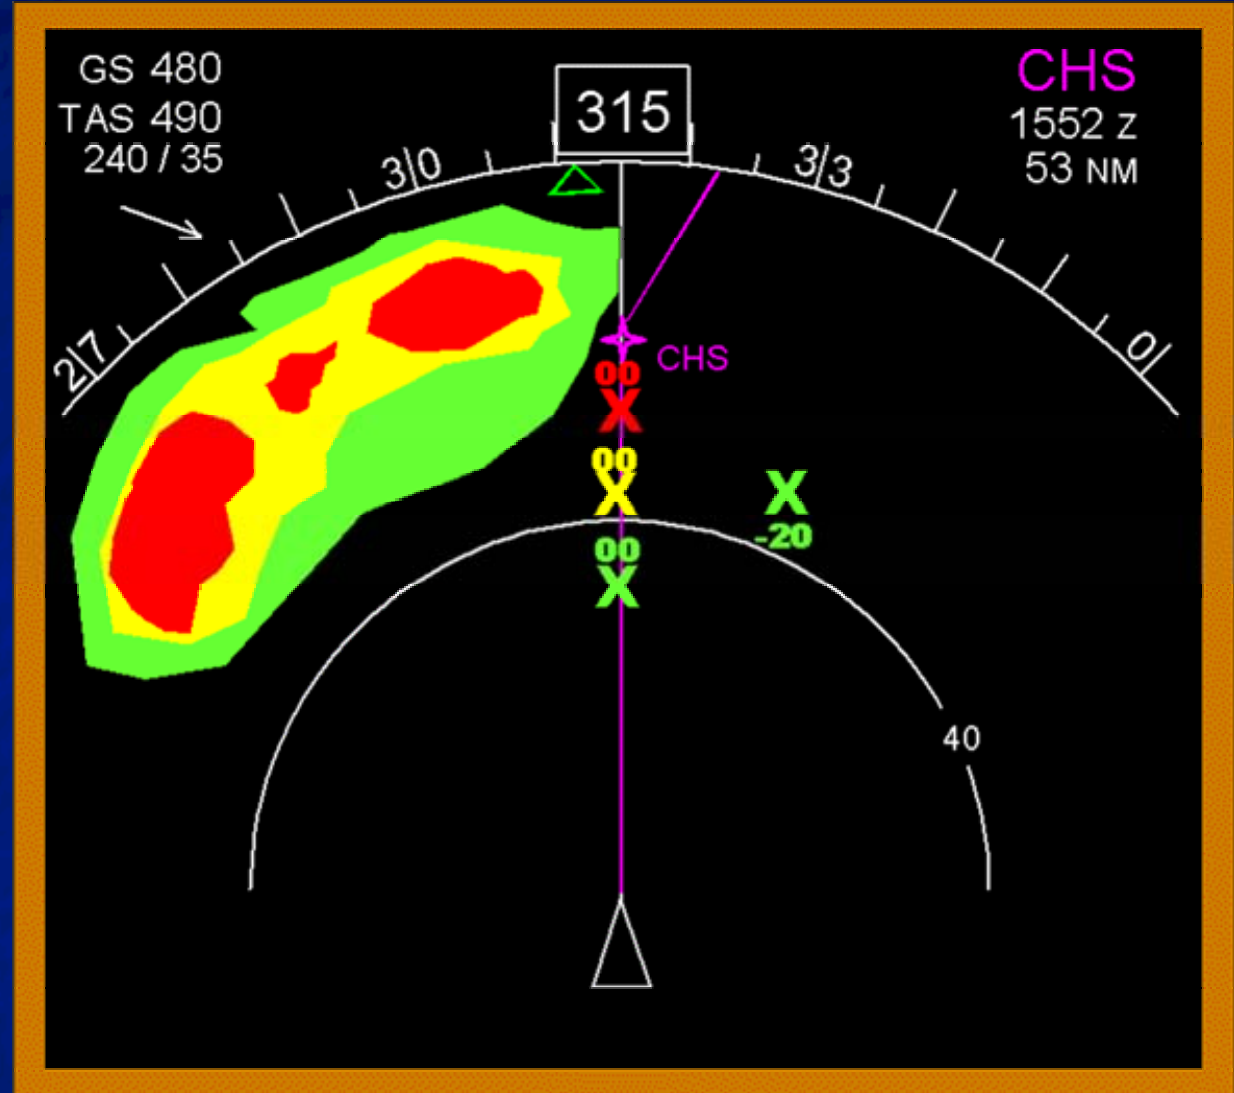

Example Operational Scenario Today: Near Convection

- Convection detected by onboard radar
- Other aircraft in general vicinity
- Turbulence reports received (voice)
- Turbulence awareness from PIREPS, ATC, AOC/dispatch
- *Situational awareness of turbulence limited*

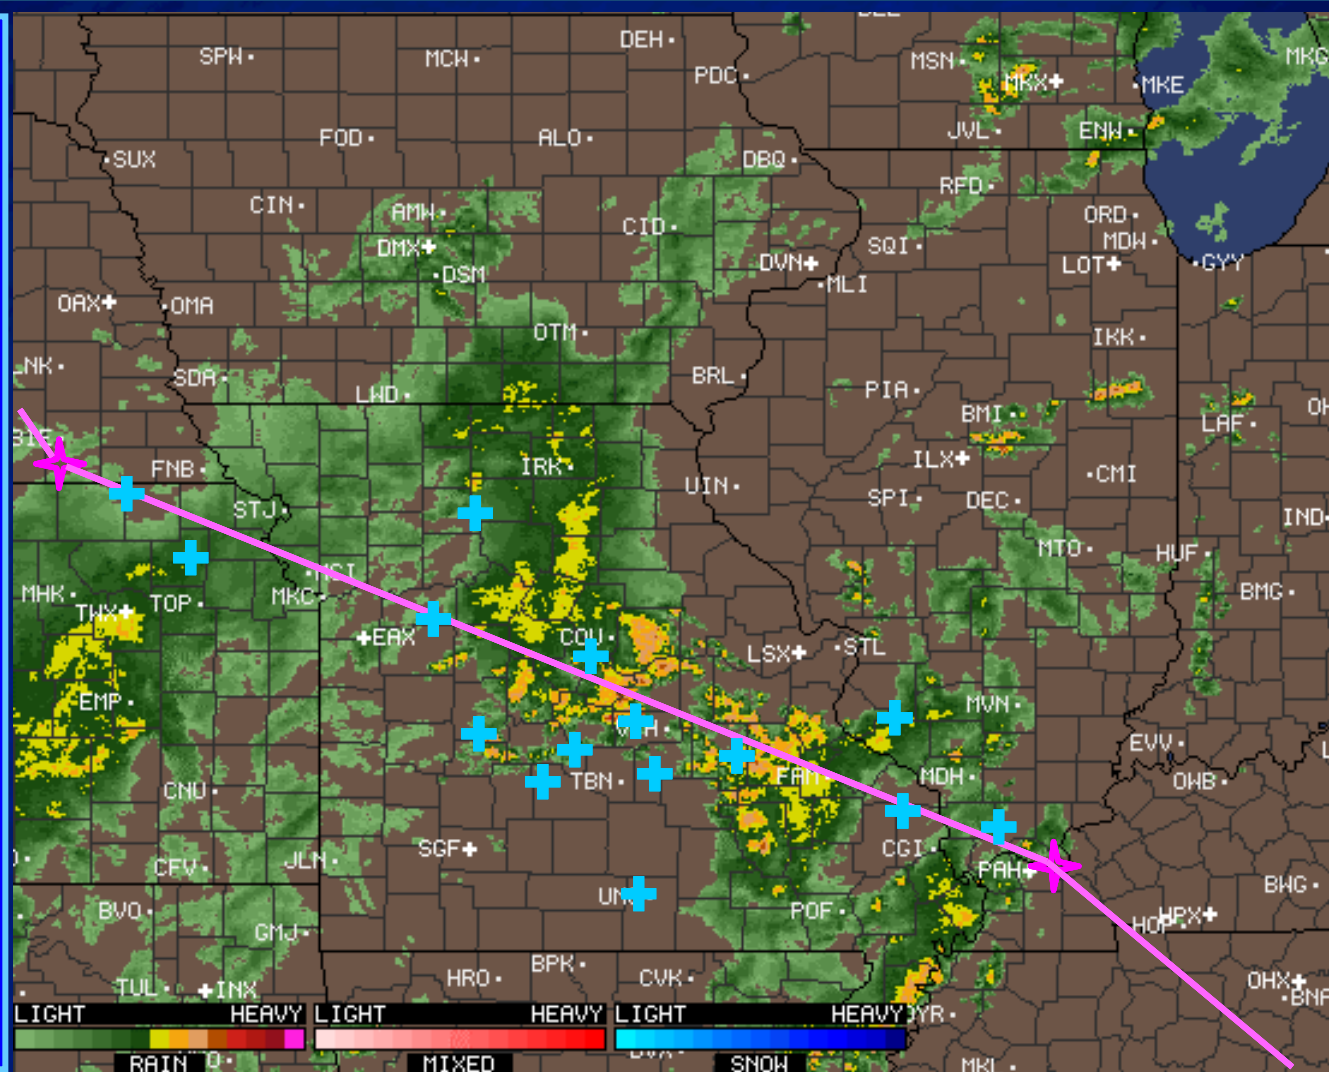

Example Scenario & *TAPS* display concept

- Data received from other aircraft is translated into a turbulence hazard for receiving aircraft.
- Same aircraft may transmit several warnings.
- Hazard warning icons color-coded **severe** moderate **light** shown with relative altitude (100's of feet).
- Provides improved situational awareness of turbulence.

Example Operational Scenario Today : Preflight Dispatch

- Region of convection affecting planned flight path (purple line).
- Other aircraft on and around flight path (blue crosses)
- PIREPS relayed to dispatch/AOC/OCC
- *Situational awareness of turbulence limited*

Example Concept Scenario: Preflight Dispatch

- Region of convection affecting planned flight path (purple line).

- Specific aircraft type, weight, speed, and altitude

- Automated reports from other aircraft scaled to designated aircraft.

- *Situational awareness of turbulence improved*

Type: B 777-200
Weight: 575,000 – 600,000 lbs
Alt: FL 310
Speed: M 0.82

Example Concept Scenario: Preflight Dispatch

-Region of convection affecting planned flight path (purple line).

- Specific aircraft type, weight, speed, and altitude

- Automated reports from other aircraft scaled to designated aircraft.

- *Situational awareness of turbulence improved*

Type: B 737-800
Weight: 130,000 – 150,000 lbs
Alt: FL 260
Speed: M 0.76

Beneficiaries of *TAPS*

Pilots – corporate & Part 121

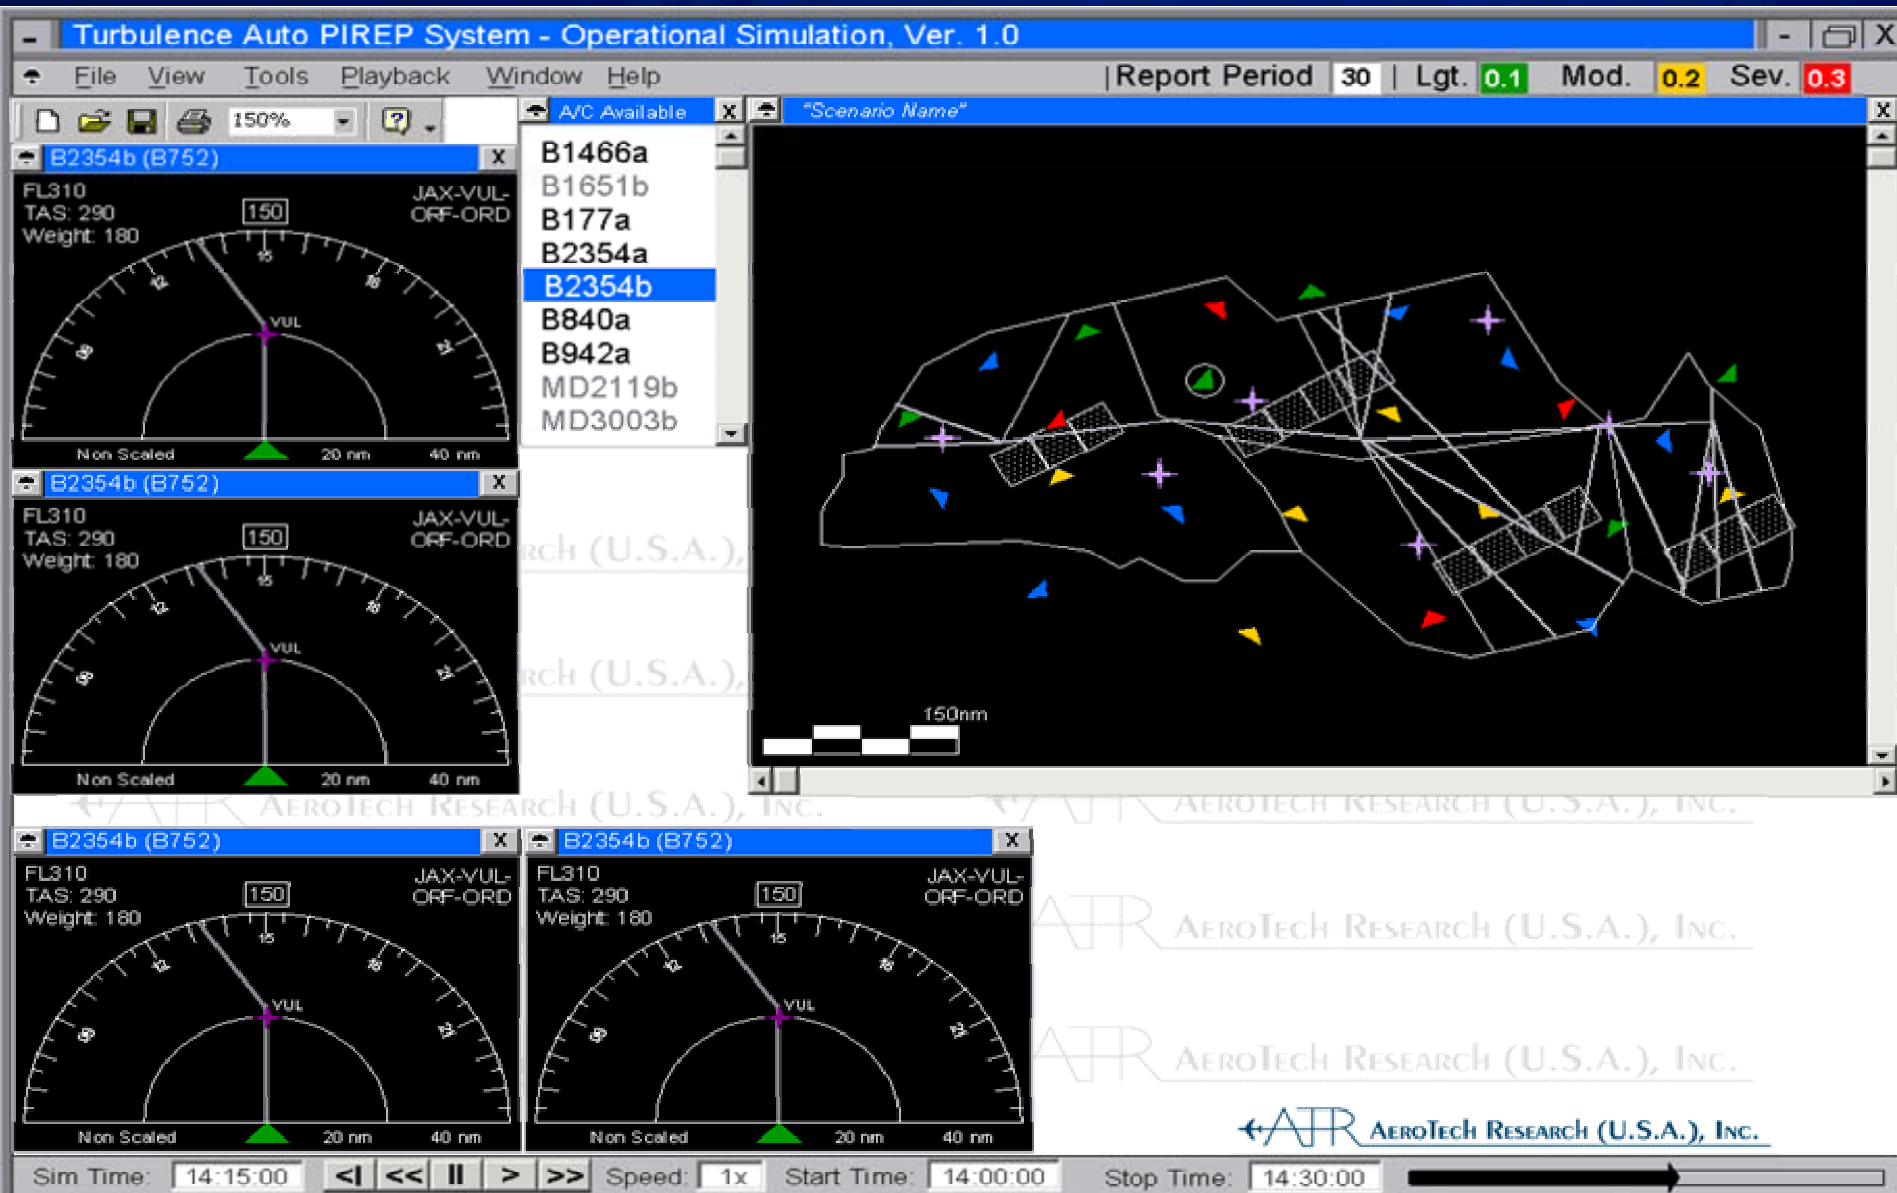

Flight Attendants & Passengers

Air Traffic Controllers

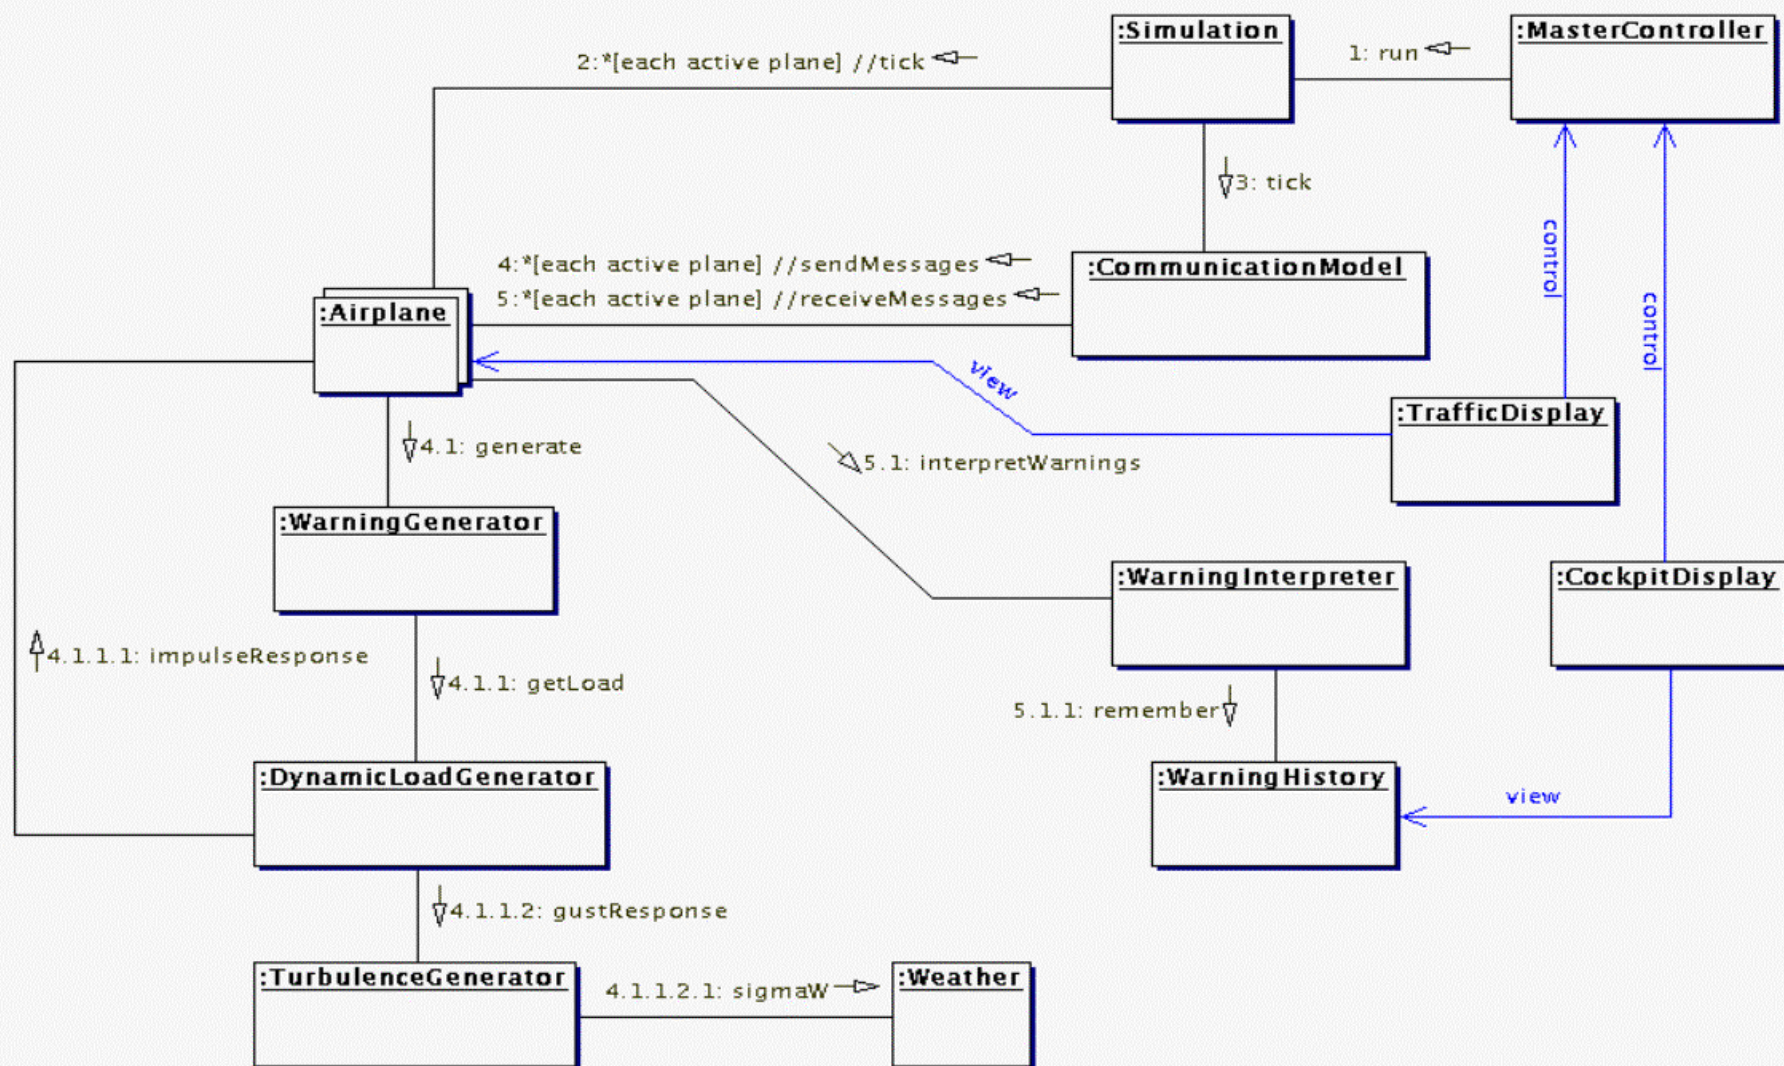

Dispatchers

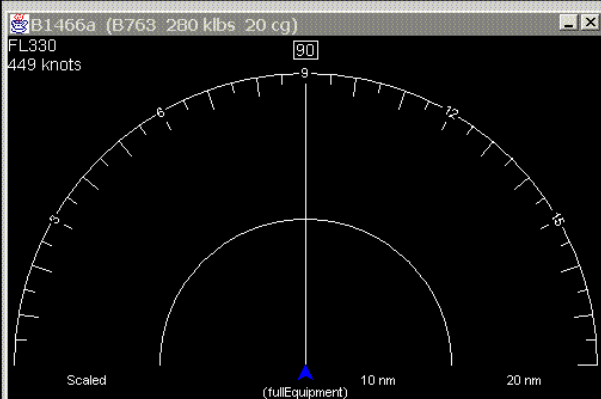

Airlines

Airborne Weather Radar

TAPS Development: Results to Date

- FY-02 flight test – single aircraft
 - Reporting logic test
 - Comms test – 0.52 sec roundtrip

NASA LaRC B-757 Research Aircraft

- Development of operational simulation for system studies.
- 1st Implementation group meeting held.

TAPS Development: 2003-2005

- FY-03 flight test – two aircraft flying in trail.
 - Real-time turbulence reports
 - Skyphone/Iridium communications
 - Turbulence hazard prediction on both aircraft.

NASA GRC Lear Jet Research Aircraft

NASA LaRC B-757 Research Aircraft

- Groundstation and cockpit display development.
- System requirements and CONOPS development.
- Further Implementation Group meetings to be held.
- FY-2005 flight evaluation.
